Extract deep links from a website -> Extract all email addresses

This script involves two steps.

Step 1: All deep links are extracted from a website you specify (make sure you include http:// or https:// as a prefix). The results are stored in a textfile.

Step 2: You can then copy& paste the name of the resulting textfile in order to extract all email addresses from it.

N.B. *This script might not work for all websites due to web-server restrictions and/or security policies.* Please use this script responsible. The website owner is not legally liable for any abuse.

Step 1: Extract deep links from a website and store them in a text file.

Step 2: Extract email addresses from the generated text file.

Optional: Send an email to all extracted email addresses.
