

Psychological warfare: Weltanschauungskrieg = The war of worldviews

Description

AI translation:

The concept of psychological warfare emerged in Nazi Germany and was later adopted by the USA.

The word is a translation of the German "Weltanschauungskrieg" (war of worldviews). Wall Street Lawyer William Donovan "Wild Bill" was one of the first to use it in the context of public relations in the USA. President Franklin Roosevelt appointed him as Director of the new U.S. intelligence agency, the Office of Strategic Services (OSS, predecessor of the CIA) who saw "psychological warfare" as an important stratagem for "[engineering of consent](#)" in the public mind (see [Chomskys & Hermans "propaganda model"](#)).

William Joseph Donovan
(January 1, 1883 – February 8,
1959)

Donovan viewed an understanding of Nazi psychological tactics as a vital source of ideas for “Americanized” versions of many of the same stratagems. Use of the new term quickly became widespread throughout the U.S. intelligence community. . . Donovan was among the first in the US to articulate a more or less unified theory of psychological warfare. . . As he saw it, the “engineering of consent” techniques used in peacetime propaganda campaigns could be quite effectively adapted to open warfare. Pro-Allied propaganda was essential to reorganizing the U.S. economy for war and for creating public support at home for intervention in Europe, Donovan believed. Fifth-column movements could be employed abroad as sources of intelligence and as morale-builders for populations under Axis control. He saw “special operations” — meaning sabotage, subversion, commando raids, and guerrilla movements — as useful for softening up targets prior to conventional military assaults. (Simpson. Science of Coercion, 1994, p. 24)

“Science of Coercion provides the first thorough examination of the role of the CIA, the Pentagon, and

other U.S. security agencies in the evolution of modern communication research, a field in the social sciences which crystallized into a distinct discipline in the early 1950s. Government-funded psychological warfare programs underwrote the academic triumph of preconceptions about communication that persist today in communication studies, advertising research, and in counterinsurgency operations. Christopher Simpson contends that it is unlikely that communication research could have emerged into its present form without regular transfusions of money from U.S. military, intelligence, and propaganda agencies during the Cold War. These agencies saw mass communication as an instrument for persuading or dominating targeted groups in the United States and abroad; as a tool for improving military operations; and perhaps most fundamentally, as a means to extend the U.S. influence more widely than ever before at a relatively modest cost. Communication research, in turn, became for a time the preferred method for testing and developing such techniques. Science of Coercion uses long-classified documents to probe the contributions made by prominent mass communication researchers such as Wilbur Schramm, Ithiel de Sola Pool, and others, then details the impact of psychological warfare projects on widely held preconceptions about social science and the nature of communication itself. A fascinating case study in the history of science and the sociology of knowledge, Science of Coercion offers valuable insights into the dynamics of ideology and the social psychology of communication."

"Space medicine began as an extension of aeronautical medicine. as airplanes developed the power and speed to achieve higher altitude, it became apparent that there were substantial challenges to human physiology that became obstacles to safe operation and pilot survival. research to understand these challenges was conducted in the early 1930s in the united states and europe. as europe progressed toward major conflict, germany's third reich instituted a formal research program in aeronautical medicine. to lead this effort they chose a renowned physician and scientist, dr. hubertus strughold. dr. strughold was implicated in experiments during wwii on humans who were detainees of the third reich but never convicted of any crimes. at the end of the war, he came to america under operation paperclip to work for the us air force, where he extended his research from aircraft to spacecraft and coined the term 'aerospace medicine.' later he was detailed from the air force to the national aeronautical and space agency (nasa). although strughold's role in nazi human subjects research has raised ethical questions about the origins of nasa's space medicine program, the us space program has developed into a model civilian agency operating with the highest of ethical standards in science and exploration. as the agency pursues exploration and colonization of the solar system and deep space, new ethical issues will arise, challenging the agency to maintain these high standards."

"Although psychological warfare was practiced to a greater degree in the vietnam conflict than in any other war in history, virtually nothing has been published about it. perhaps few wished to be identified with such activity, or it may be that security considerations prevented discussion of the operations. at any rate, the end of the cold war has made it possible to take a brief look at a hitherto unknown (or undiscussed) subject. this article, however, does not make a pretense of being comprehensive for the whole war, but rather reflects personal observations during one brief period of intense fighting-the summer of 1966."

"This article argues that the concept of a national or peoples community (volksgemeinschaft) was a key element in the revolutionary aims of the nazi regime, and illustrates the remarkably ambitious nature of its propaganda. propaganda presented an image of society that had successfully manufactured a national community by transcending social and class divisiveness through a new ethnic unity based on true german values. but was there a gap between the claims trumpeted in nazi propaganda and social reality? the intention of this article is to reappraise the effectiveness (or otherwise) of volksgemeinschaft by analysing the response from two sections of the community; the industrial working class and german youth."

"How do the media affect public support for democratic institutions in a fragile democracy? what role do they play in a dictatorial regime? we study these questions in the context of germany of the 1920s and 1930s. during the democratic period, when the weimar

government introduced pro-government political news, the growth of nazi popularity slowed down in areas with access to radio. this effect was reversed during the campaign for the last competitive election as a result of the pro-nazi radio broadcast following hitler's appointment as german chancellor. during the consolidation of dictatorship, radio propaganda helped the nazis to enroll new party members. after the nazis established their rule, radio propaganda incited anti-semitic acts and denunciations of jews to authorities by ordinary germans. the effect of anti-semitic propaganda varied depending on the listeners' predispositions toward the message. nazi radio was most effective in places where anti-semitism was historically high and had a negative effect in places with historically low anti-semitism. Show/hide publication abstract

"Political actors are using algorithms in efforts to sway public opinion. in some circumstances, the ways coded automation interacts with or affects human users are unforeseeable. in others, individuals and organizations build software that purposefully targets voters, activists, the media and political opponents. computational propaganda is the assemblage of social media, autonomous agents and algorithms tasked with the manipulation of opinion. automated scripts equipped with big data work over social media to advance ideological viewpoints. politicized social bots are one version of potentially malicious programs. state and non-state political actors have used computational propaganda to manipulate conversations, demobilize opposition and generate false support on twitter, facebook and instagram. understanding how technologies like these are used to spread propaganda and misinformation, engage with citizens and influence political outcomes is a pressing problem. we have worked with computer scientists to detect bots and misinformation in 'real time' during political events in germany. furthermore, we have interviewed german bot developers, journalists, data scientists, policy makers, academics, cyberwarfare specialists and victims of automated political attacks in order to investigate potential impacts of computational propaganda, especially in relation to the bundestagswahlen 2017 and ongoing right-wing currents in the public discourse. part 1 discusses social bot activity in germany and empirically analyses their employment during elections. part 2 evaluates misinformation and junk news. part 3 examines the political, commercial and social responses to computational propaganda. the findings presented structure the dispersed public debate on online propaganda, relate proposed countermeasures to empirical evidence and serve as a benchmark for evaluating computational propaganda activity in germany."

"The study of mass communications can be divided into three parts: intent analysis, content analysis and effect analysis. this order not only reflects chronology. by placing content analysis in the middle position, it also highlights the contribution of that procedure to the

other two, namely, to support inferences about intent on the one hand and effect or response on the other. this paper reports a number of special attempts to discern the intentions of enemy propaganda during world war ii by means of rigorous analysis of the manifest content of the communications under control. among the many other problems in the area of intent analysis is the problem of discovering whether two communications-controlling groups, formally related or not, actually collaborate in their propaganda output; and if so, under what conditions, in what ways, and to what extent. this is the general context of this study. specifically, the subject of investigation was the nature of collaboration between the german and italian propaganda ministries in their short-wave radio output beamed to north america just before and after the entry of the united states into the war."

"The article focuses on the understanding of the definition and theory of propaganda. it notes the immediate link of propaganda with political extremism and german war personalities like adolph hitler and josef goebbels. it examines the etymological origin of the word propaganda. it mentions that during the world war i, social commentary became propaganda in the u.s. and at the beginning of the world war ii, propaganda analysis propagated but was later substituted with a new form of communication research. furthermore, it states that the term propaganda was replaced with several words including persuasion, communication, and information in 1940."

"In this article, simmel compares and contrasts the philosophical weltanschauungen of kant and goethe. simmel points out that whereas kant's solution to the problem of knowledge and understanding involved the separation of subject from object, the mediation of senses through the concept and internalization of nature as representation, goethe sought to unify subject and object through the ideation of the senses and the immersion of the subject in nature. simmel points out that for goethe the philosophical first principle was life, leben, not reason. for goethe thought is an organic expression of leben, not the result of an imaginative synthesis of sensory intuitions. at the end of the article simmel seems to suggest that the modern philosophers must decide: kant or goethe! a choice between mechanism and vitalism; ontological separation and immersion."
